

BOS Marketplace Platform – Cost Justification (₹3,00,000)

Project Overview

The BOS platform is a classified marketplace similar to OLX, covering multiple categories such as automobiles, electronics, furniture, and real estate.

The platform includes Aadhaar-based user verification, role-based access control, deep category-specific filters, location-based search, and a scalable backend architecture.

Why This Is Not a Simple Website

- Multiple product categories with independent data models and logic
 - Aadhaar-based verification controlling posting and contact access
 - Dynamic brand-to-model and attribute-based filtering
 - Distance-based listing, sorting, and search functionality
 - Secure authentication and conditional UI behavior for verified users
-

Engineering Effort

The overall development effort is estimated at approximately **90 days** of senior full-stack engineering work, covering:

- Backend API and database development
 - Frontend UI and user experience implementation
 - Filter, search, and location logic
 - Security, testing, and deployment
-

Market Comparison

- Small agencies typically charge between **₹5,00,000 and ₹10,00,000**
 - Freelancers with limited scope charge between **₹3,50,000 and ₹4,50,000**
 - This proposal of **₹3,00,000** reflects direct development without agency overheads
-

What the ₹3,00,000 Covers

- End-to-end development of the BOS marketplace MVP as per shared requirements
- Scalable and maintainable architecture and clean codebase
- Deployment-ready system with full source code handover
- No dependency on profit sharing or future financial obligations

Conclusion

A development cost of **₹3,00,000** is fair and justified for building a production-ready classified marketplace platform.

Any further reduction in cost would require scope reduction or compromise on quality, which is not advisable for a scalable product.
